```
ING1. Functional cooperation between ING1 and p53 suggested that

ING2 encoded a tumour suppressor protein that functioned within the
p53 pathway. This data suggested a possible role for ING1 in head
and neck cancers and chromosomal location of the ING1 placed it
within a region that is frequently rearranged in head and neck
cancers. Large scale analysis of tumours involving ING1 has not
revealed mutations in ING1 nor significant variations in its
cancer clology. However, alternative initiation exons of the ing1
cancer clology. However, alternative initiation exons of the ing1
cancer clology. However, alternative initiation exons of the ing1
cancer clology. However, alternative initiation exons of the ing1
cancer clology. However, alternative initiation across of the ing1
cancer clology. However, alternative initiation across of the ing1
cancer clology. However, alternative initiation across of the ing1
cancer clology. However, alternative initiation exons of the ing1
cancer clology. However, alternative initiation across of the ing1
cancer clology. However, alternative initiation across of the ing1
cancer clology. However, alternative initiation across of the ing1
cancer clology. However, alternative initiation across of the ing1
cancer clology. However, alternation of those expressing wild type p53 p37TNG1 is able to cause
proliferation or transformation of those cells. Thus detecting a
cucleic acid encoding exon ib of ing1 by phybridisation with an
coloring coloring exon ib of ing1 by phybridisation with an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                      or its antisense sequence can identify individuals expressing the oncogenic form of ingl. Novel peptide sequences taken from the 104 N-terminal peptide of p371NG1 can also be used to raise antibodies that can also be used in detection methods for the p371NG1 variant. The polypeptides may be useful in gene therapy for treatment of cell proliferation disorders, especially cancers and for diagnosing and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                          the p53 pathway occurs in a much larger proportion of tuncurs. In many cases the mechanism of functional inactivation of tuncurs. In many cases the mechanism of functional inactivation of the p53 gene remains unknown but p53 has been found to act in cooperation with 10G1. Functional cooperation between 1NG1 and p53 suggested that in NG1 encoded a tumour suppressor protein that functioned within the p53 gaptemay. This data suggested a possible role for ING1 in head and neck cancers and chromosomal location of the ING1 placed it within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not revealed mutations in ING1 nor significant variations in its expression suggesting that ING1 was not a useful gene to study in cancer etology. However, alternative initiation exons of the ing1 gene, each having their own promoter have been discovered...

Expression of one promoter (la) produces a protein having an identical C-terminal fragment to ING1 but an additional lot N-terminal amino acids. The newly discovered protein has been characteristics of an oncogene. When overexpressed in cells (even those expressing wild type: p331NG1). p371NG1 has the characteristics of an oncogene. When overexpressed in cells (even proliferation or transformation of those cells: Thus detecting a proliferation or transformation of these cells. Thus detecting a proliferation or transformation of these cells. Thus detecting a proliferation or transformation of these cells. Thus detecting a proliferation or transformation of these cells. Thus detecting a proliferation or transformation of these cells. Thus detecting a proliferation or transformation of these cells. Thus detecting a proliferation or transformation of these cells. Thus detecting a proliferation or transformation of the cells of the part of the cells of

In many cases the mechanism of functional inactivation of tumours. In Instants unknown but p53 has been found to act in cooperation with ING1 encoded a tumour suppressor protein that functioned within the p53 pathway. This data suggested a possible role for ING1 in head and neck cancers and chromosomal location of the ING1 placed it within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not

        reveated mutations in this incl and variations in its cancer ethology. However, alternative initiation exons of the ingl cancer ethology. However, alternative initiation exons of the ingl cancer ethology. However, alternative initiation exons of the ingl gene, each having their own promoter have been discovered.

Expression of one promoter (la) produces a protein identical to inGl. Expression of a second promoter (lb) produces a protein having on identical Crterminal fragment to ING1 but an additional 104 in designated p37ING1 (Wild type: p331NG1). p37ING1 has the designated p37ING1 (Wild type: p331NG1). p37ING1 has the those expression wild type p33) p37ING1 is able to cause those expression or transformation of those calls. Thus detecting a nucleic acid encoding exon 1b of ing1 by hybridisation with an isolated nucleic acid maving the sequence of exon 1b of ing1 is solated nucleic acid maving the sequence of exon 1b of ing1 or its antisense sequence can identify individuals expressing the oncogenic form of ing1. Novel peptide sequences taken from the 104 or terminal peptide of p37ING1 can also be used in detection methods for the p37ING1 variant.

The polypeptides may be useful in gene therapy for treatment of cell profileration disorders, especially cancers and for diagnosing and

This is the amino acid sequence of the human p28-ING1 protein, used in the method of the invention, involving the human p33-ING1 protein. The ING1 gene encodes p33-ING1 which can be used to modulate the activity of, isolate or detect p53. Expression of the ING1 and p53 genes in a mammalian cell results in normal growth requilation anchorage-dependent growth and apoptosis as a response to irreversible DNA damage and other cellular insult. Inhibition of expression of either gene results in a loss of cellular growth confrol, anchorage independent growth, inhibition of apoptosis and resistance to radiation and cytotoxic drugs. The p33-ING1 is a component of the p53 signalling pathway that cooperates with p53 in negative regulation of cell proliferation by modulating p53 dependent component of the p53 signalling pathway can therefore be regulated (both enhanced or suppressed) by modulating p33-ING1 activity. The modulating negative regulation of restoration of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy and pathway can be required the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in anticancer therapy or for the suppression of the p53 pathway in the p53 p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a human cancer associated antigen. The sequence is a variant of the ING1 gene, which is a tumour suppressor gene candidate. The cancer associated antigen polynucleotides and polypeptides are useful for screening for the possible presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated cancer associated nucleic acid molecule identified by SEREX (serological identification of antigens by recombinant expression cloning) technique, useful in nucleic acid based therapies to treat

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nutations in or loss of the p53 gene occur in more than 50% of human tumours and tumour cell lines, but functional inactivation of human tumours and tumour cell lines, but functional inactivation of tumours. In many cases the mechanism of functional inactivation of the p53 gene remains unknown but p53 has been found to act in cooperation with cremains unknown but p53 has been found to act in cooperation with NG1. Functional cooperation between ING1 and p53 suggested that ING1 encoded a tumour suppressor protein that functioned within the p53 pathway. This data suggested a possible role for ING1 in head and neck cancers and chromosomal location of the ING1 placed it within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not revealed mutations in ING1 nor significant variations in its cancer etiology. However, alternative initiation exons of the ing1 gene, each having their own promoter have been discovered. Cancer etiology. However, alternative initiation exons of the ing1 gene, each having their own promoter (1b) produces a protein having an identical C-terminal fragment to ING1 but an additional 104 cancer characteristics of an oncogene. When overexpressed in cells (even characteristics of an oncogene. When overexpressed in cells (even the characteristics of an oncogene. When overexpressed in cells (even the compand of the compand to the conservation of the conservation of the cause

The tumour suppressors of the invention are involved in the regulation of cell proliferation and in the control of cellular aging, anchorage dependence and apoptosis. The tumour suppressor protein, p471NG3, nucleic acids encoding it and antibodies against it are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
proliferation or transformation of those cells. Thus detecting a nucleic acid encoding exon 1b of ing1 by hybridisation with an isolated nucleic acid having the sequence of exon 1b of ing1 or its antisense sequence can identify individuals expressing the oncogenic form of ing1. Novel peptide sequences taken from the 104 N-terminal peptide of p371NG1 can also be used to raise antibodies that can also be useful in gene therapy for treatment of cell proliferation disorders, especially cancers and for diagnosing and
                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a human cancer associated antigen. The sequence is a variant of the ING1 gene, which is a tumour suppressor gene candidate. The cancer associated antigen polynucleotides and polypeptides are useful for screening for the possible presence of a pathological condition in a subject such as cancer. The cancer associated antigen polypeptides are useful for producing vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chen Y;

A full-length sequence (AAM19119) is provided of novel tumour suppressor protein p33NG1. It was deduced from a cDNA clone (AAT69652) obtd. from normal human fibroblast cells. Overexpression of p33NG1 (formerly p331G1) is thought to inhibit cell growth and DNA synthesis, probably by arresting cells in the G1 phase of the cell cycle. p331NG1 is expressed in normal mammary epithelial mammary epithelial cell lines and is not expressed in many primary brain tumours. p331NG1 can be administered to patients as a means of decreasing proliferation of cancer cells, or can be used to raise antibodies useful for the diagnosis of cancer, esp. breast
                                                                                                                                                                                                                                                                                                                                                                                                                                             Caps

This is the amino acid sequence of the human p33-ING1 protein, used in the method of the invention. The ING1 gene encodes p33-ING1 which can be used to modulate the activity of, isolate or detect p53.

Expression of the ING1 and p53 genes in a mammalian cell results in normal growth regulation anchorage-dependent growth and apoptosis as a response to irreversible DNA damage and other cellular insult.

Inhibition of expression of either gene results in a loss of cellular growth control, anchorage independent growth, inhibition of apoptosis and resistance to radiation and cytotoxic drugs. The p33-ING1 is a component of the p53 signalling pathway that cooperates with p53 in negative regulation of cell proliferation by modulating p53 dependent transcriptional activation. Biological function of p53 signalling pathway can therefore be regulated (both enhanced or suppressed) by modulating p33-ING1 activity. The modulation of p33-ING1 activity can be used for the stimulation or restoration of the p53 pathway in anti cancer therapy or for the suppression of the p53 pathway to anti cancer therapy or for the suppression of the p53 pathway to immortal cell lines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of human p331NG1, a novel inhibitor of cell growth and a candidate tumour suppressor. The sequence was deduced from full-length ING1 CDNA (see AAV62285) obtained using a positive selection procedure that combined subtractive hybridisation with an in vivo selection assay to identify growth-suppressor. His expressed in normal mammary epithelial cells, but is expressed only at lower levels in several cancerous mammary epithelial cell lines and is not expressed in many primary brain capthelial cell lines and is not expressed in many primary brain cumours. A claimed method to potentiate apoptosis in a eukaryotic cell involves administering an active p331NG1 peptide or an oligonucleotide encoding such as a peptide. A claimed method for inhibiting apoptosis in a eukaryotic cell involves administering an antisense oligonucleotide. Also claimed are a method for determining the apoptotic characteristics of a eukaryotic cell, and an isolated eukaryotic cell substantially free of p331NG1 ecil, and an isolated eukaryotic cell substantially free of p331NG1 encivity in a eukaryotic cell, and an isolated eukaryotic cell substantially free of p331NG1 eximints that may be used to induce apoptosis in eukaryotic cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating eukaryotic apoptosis by increasing p331NG1 activity - using p331NG1 derivatives, to induce apoptosis in cancer cells, and in the investigation of apoptotic pathways
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Murphy L., Harris D., Barrell B.G., Rajandream M.A., Wood V.;
Submitted (AUG-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: DNA-DEPENDEWT RNA POLYMERASE CATALYZES THE TRANSCRIPTION
OF DNA INTO RNA USING THE FOUR RIBONUCLEOSIDE TRIPHOSPHATES AS
                                                                                                                                                                                                                                                                                                         POLYMERASES.
SUBCELLULAR LOCATION: Nuclear.
SUBCELLULAR LOCATION: Nuclear.
MISCELLANDROUS: THREE DISTINCT ZINC-CONTAINING RNA POLYMERASES ARE
FOUND IN EUKARYOTIC NUCLEI: POLYMERASE I FOR THE RIBOSOMAL RNA
PRECURSOR, POLYMERASE II FOR THE MRNA PRECURSOR, AND POLYMERASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  III FOR 5S AND TRNA GENES.
-!- SIMILARITY: BELONGS TO THE ARCHAEBACTERIA RPON / EUKARYOTIC RPB10 RNA POLYMERASE SUBUNIT FAMILY.
                                                                                                                                                                                                            {RNA}(N).
-!- SUBUNIT: EACH CLASS OF RNA POLYMERASE IS ASSEMBLED FROM 9 TO 15
DIFFERENT POLYPEPTIDES. THIS SUBUNIT IS SHARED BY ALL 3 YEAST RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bult C.J., White O., Olsen G.J., Zhou L., Fleischmann R.D.,

                                                                                                                                                                                                                                                                                                                                                                            entitles requires a license agreement (See http://www.isb-sib.ch/announce/
or send an email to license@isb-sib.ch).
                                                                                                                                                                       -i. CATALYTIC ACTIVITY: ATP-independent breakage of single-stranded DNA, followed by passage and rejoining.
-i. MISCELLANGOUS: WHEN A TOPOLOSOMERASE TRANSIENTLY BREAKS A DNA BACKBONE BOND, IT SIMULTANEOUSLY FORMS A PROTEIN-DNA LINK, IN WHICH A TYROSYL OXYGEN IN THE ENZYME IS JOINED TO A DNA PHOSPHORUS AT ONE END OF THE ENZYME-SEVERED DNA STRAND.
-i. SIMILARITY: BELONGS TO PROKARYOTIC TYPE I/III TOPOLSOMERASE FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL outstation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    THE CELL CYCLE-DEPENDENT PHOSPHORYLATION OF THREE SERINE RESIDUES PERVEYES SWIS FROM ENTERING THE NUCLEUS, AND IT ACCUMULATES IN THE CYTOPLASM. AS A CONSEQUENCE OF CDC28 KINASE INACTIVATION AT THE END OF ANAPHASE, THE THREE SERINE RESIDUES ARE DEPHOSPHORYLATED AND SWIS ENTERS THE NUCLEUS TO ACTIVATE TRANSCRIPTION. IT IS THEN RAPIDLY DEGRADED. THERONINE PHOSPHORYLATION ALSO SEEMS TO OCCUR. SIMILARITY: STRONG, TO YEAST METALLOTHIONEIN EXPRESSION ACTIVATOR

Patent No. 6207416
GENERAL INFORMATION:
APPLICANT: Tsarev, Sergei. A., Emerson,
TITLE OF INVENTION: Recombinant Proteins Of
TITLE OF INVENTION: A Pakistani Strain Of Hepatitis E And Their
TITLE OF INVENTION: Use In Diagnostic Methods And Vaccines
NUMBER OF SEQUENCES: 107
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                          The polynuclectide sequences given in AAC79799 to AAC79848 encode the human secreted proteins given in AAB44762 to AAB44811. AAB44812 to AAB44892 represent human secreted polypeptide sequences and proteins conditions to them, which are used in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities are:

Condition Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities are:

Conforted to an interthritic; antibacterial; variathmentic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic;

Conforted to ameliorate a medical condition in e.g. humans, mice, prevent, treat or ameliorate a medical condition in e.g. humans, mice, cabbits, poats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmum diaseases, hyperproliferative disorders, cardiovascular disorders, and ocular disorders, cardiovascular disorders, and ocular disorders, and so used to aid wound healing and ceptihelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of polypeptides can also be used to aid wound healing and ceptimary tissues to regenerate tissues and in chemotrais. The condition of the present incention

The polynucleotide sequences given in AAC79799 to AAC79848 encode the human secreted proteins given in AAB4462 to AAB44811. AAB44812 to AAB44829 represent human secreted polypeptide sequences and proteins compared to them, which are used in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in Examples of activities are: immunosuppressive; antiarthritic; antirheumatic; antiprolliferative; cytostatic; cardiant; vasotropic; errebroprotective; nootropic; cytostatic; antibacterial; virucide; fungicide; and ophthalmological. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a condition. Disorders which are diagnosed or treated include autoimmune diseases, hyperprollferative disorders, cardiovascular disorders, cerebrovascular disorders, angiogenesis, nervous system clisorders, infections caused by bacteria, viruses and fungi and ocular disorders. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; secreted protein; diagnosis; immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; ophthalmological; gene therapy; autoimmune disease; infection; hyperproliferative disorder; cardiovascular disorder; anglogenesis; cerebrovascular disorder; nervous system disorder; ocular disorder; wound healing; skin aging; food additive; preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC79790 to AAC79798 and AAB4761 represent sequences used in the exemplification of the present
                                                                                                                                                    Nucleic acid encoding human secreted proteins, used to treat, prevent, ameliorate or diagnose medical conditions such as cancer, and autoimmune diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Invention, numan secreted processed in. Examples of activities are:

and cells the genes are expressed in. Examples of activities are:

Immunosuppressive; antiarthritic; antirheumatic; antiproliferative;

Cytostatic; cardiant; vasotropic; cerebroprotective; nootropic;

neuroprotective; antibacterial; virucide; fungicide; and

pervent, treat or ameliorate a medical condition in e.g. humans, mice,

rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used

in diagnosing a pathological condition or susceptibility to a

pathological condition. Disorders which are diagnosed or treated include

autoimnume diseases, hyperproliferative disorders, cardiovascular

disorders, cerebrovascular disorders, angiogenesis, nervous system

disorders, infections caused by bacteria, viruses and fungi and ocular

disorders. Infections caused by bacteria, viruses and fungi and ocular

disorders. The polypeptides can also be used to aid wound healing and

epithelial cell proliferation, to prevent skin aging due to subburn, to

maintain organs before transplantation, for supporting cell culture of

polypeptides can also be used as a foremeaxis. The

conjections caused as a discussion of the present

conference or decrease storage capabilities. AAC79798 and

cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens have cytostatic activity and can be used in gene therapy and vacchae production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally. N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell on express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                   ö
                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell:cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents E. maxima T-lymphocyte stimulatory protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    encoding Eimeria T-lymphocyte stimulatory protein - used in sines to protect poultry against coccidiosis, and to develop is. for diagnosis of Eimeria infection
